

METABOLIC CLINIC PROGRESS NOTE

Six month follow-up · Established patient

Patient Daniel Okafor · 63M · DOB 1962-04-27
Patient ID PT-4470885
Primary diagnosis E75.22 · Gaucher disease, type 1

SUBJECTIVE

The patient returns for routine six month follow-up of Gaucher disease type 1 on enzyme replacement therapy, now in month 38. He reports no bone pain, no bleeding, and no abdominal fullness. Energy is good and he continues to work full time. He has not missed an infusion in the past twelve months and reports no infusion reactions. He asks about extending the interval between infusions.

OBJECTIVE

Well-appearing man. Abdomen soft, non-tender. Spleen palpable 2 cm below the left costal margin, reduced from 7 cm at diagnosis. Liver edge not palpable. No ecchymoses or petechiae. No bony tenderness over either femur. Weight 85 kg, stable.

ASSESSMENT

Gaucher disease type 1, E75.22, stable on Zymvora 60 units per kilogram every two weeks. Haematologic response sustained: haemoglobin 13.4 g/dL and platelet count 168 K/uL on 2026-06-11, against pre-treatment values of 9.8 g/dL and 74 K/uL. Chitotriosidase remains elevated at 1,840 nmol/mL/h but has fallen from 14,200 at diagnosis. Last abdominal MRI was 2025-11-20, nine months ago, showing splenic volume 3.1 and hepatic volume 1.2 multiples of normal. Repeat imaging is overdue.

PLAN

Continue Zymvora 60 units per kilogram every two weeks; no dose change. Renewal submitted through ArvelisConnect ahead of the 2026-09-14 authorization expiry. Abdominal MRI ordered, scheduled 2026-09-22. Repeat CBC and biomarkers at that visit. Do not extend the infusion interval until imaging is reviewed. Return in six months or sooner if symptoms change.
